

# Agenda

- Treatment goals.
- Guidelines: ADA 2022
- Different anti-diabetic drugs (Advantages-Disadvantages)
- Drug selection (First- Second and Third choices)
- Conclusion.

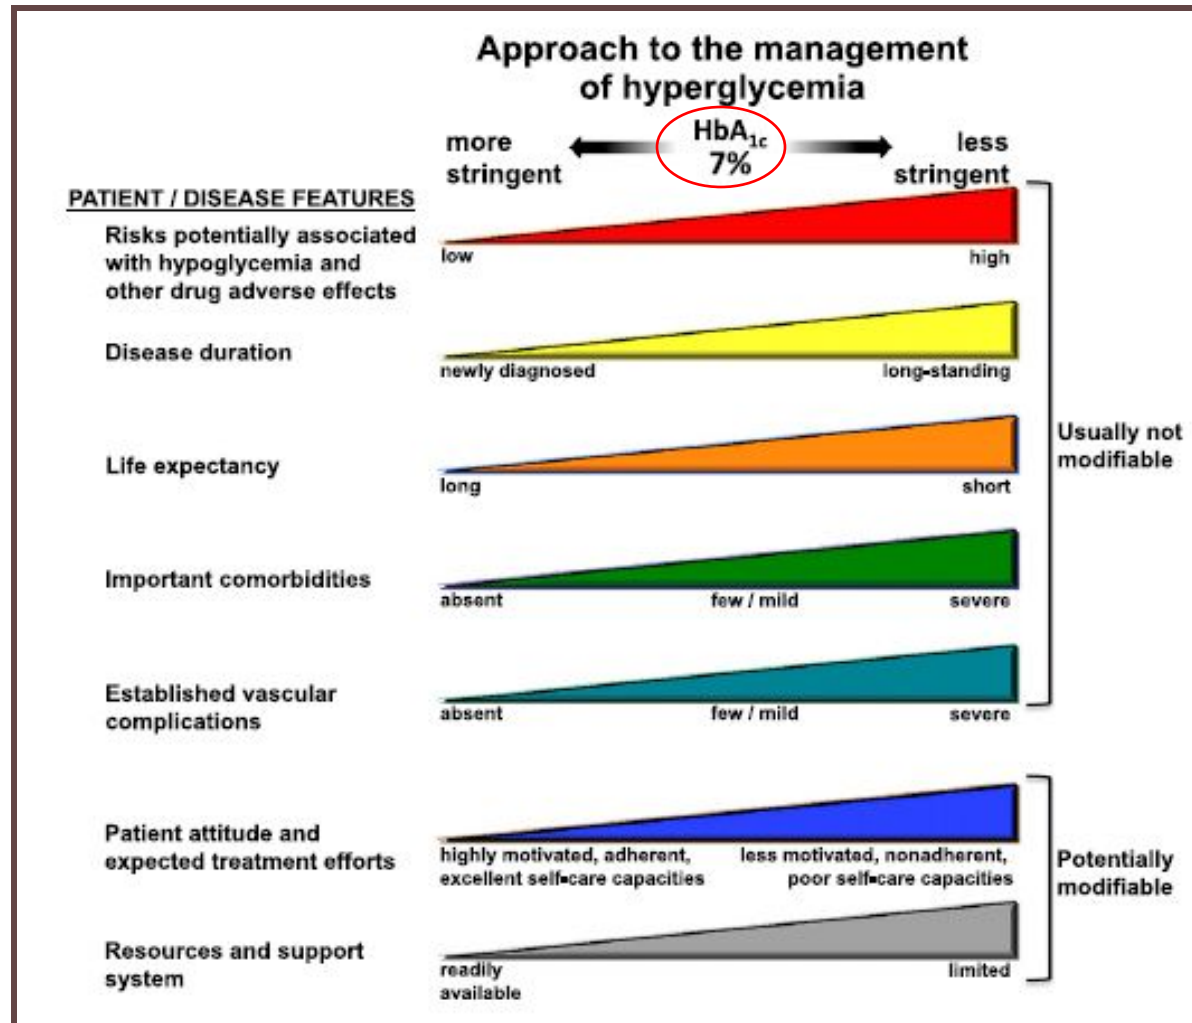

# Treatment goals

## Summary of glycemic recommendations for non-pregnant adults with diabetes.

A1C	<7.0% (53 mmol/mol)*
Preprandial capillary plasma glucose	80–130 mg/dL* (4.4–7.2 mmol/L)
Peak postprandial capillary plasma glucose†	<180 mg/dL* (10.0 mmol/L)

\*More or less stringent glycemic goals may be appropriate for individual patients. **Goals should be individualized** based on **duration** of diabetes, **age/life expectancy**, **comorbid** conditions, known **CVD** or advanced **microvascular complications**, **hypoglycemia unawareness**, and individual patient considerations.

# Approach to the management of hyperglycemia

## More Stringent HbA1c Targets <6.5%

- Short disease duration.
- Long life expectancy.
- No significant CVD .
- Type 2 diabetes treated with lifestyle or metformin only.

If this can be achieved without significant hypoglycemia or other adverse effects of treatment.

## Less Stringent HbA1c Targets < 8.0

- History of severe hypoglycemia.
- Limited life expectancy.
- Advanced complications.
- Extensive comorbid conditions.
- In whom the target is difficult to attain despite intensive self-management education, repeated counseling, and effective doses of multiple glucose-lowering agents, including insulin.

# Start with insulin therapy

- The early introduction of insulin should be considered if there is :
  - evidence of ongoing catabolism (weight loss),
  - if symptoms of hyperglycemia are present
  - when A1C levels ( $>10\%$  [86 mol/mol]) or blood glucose levels ( $>300$  mg/dL [16.7 mmol/L]) are very high. E

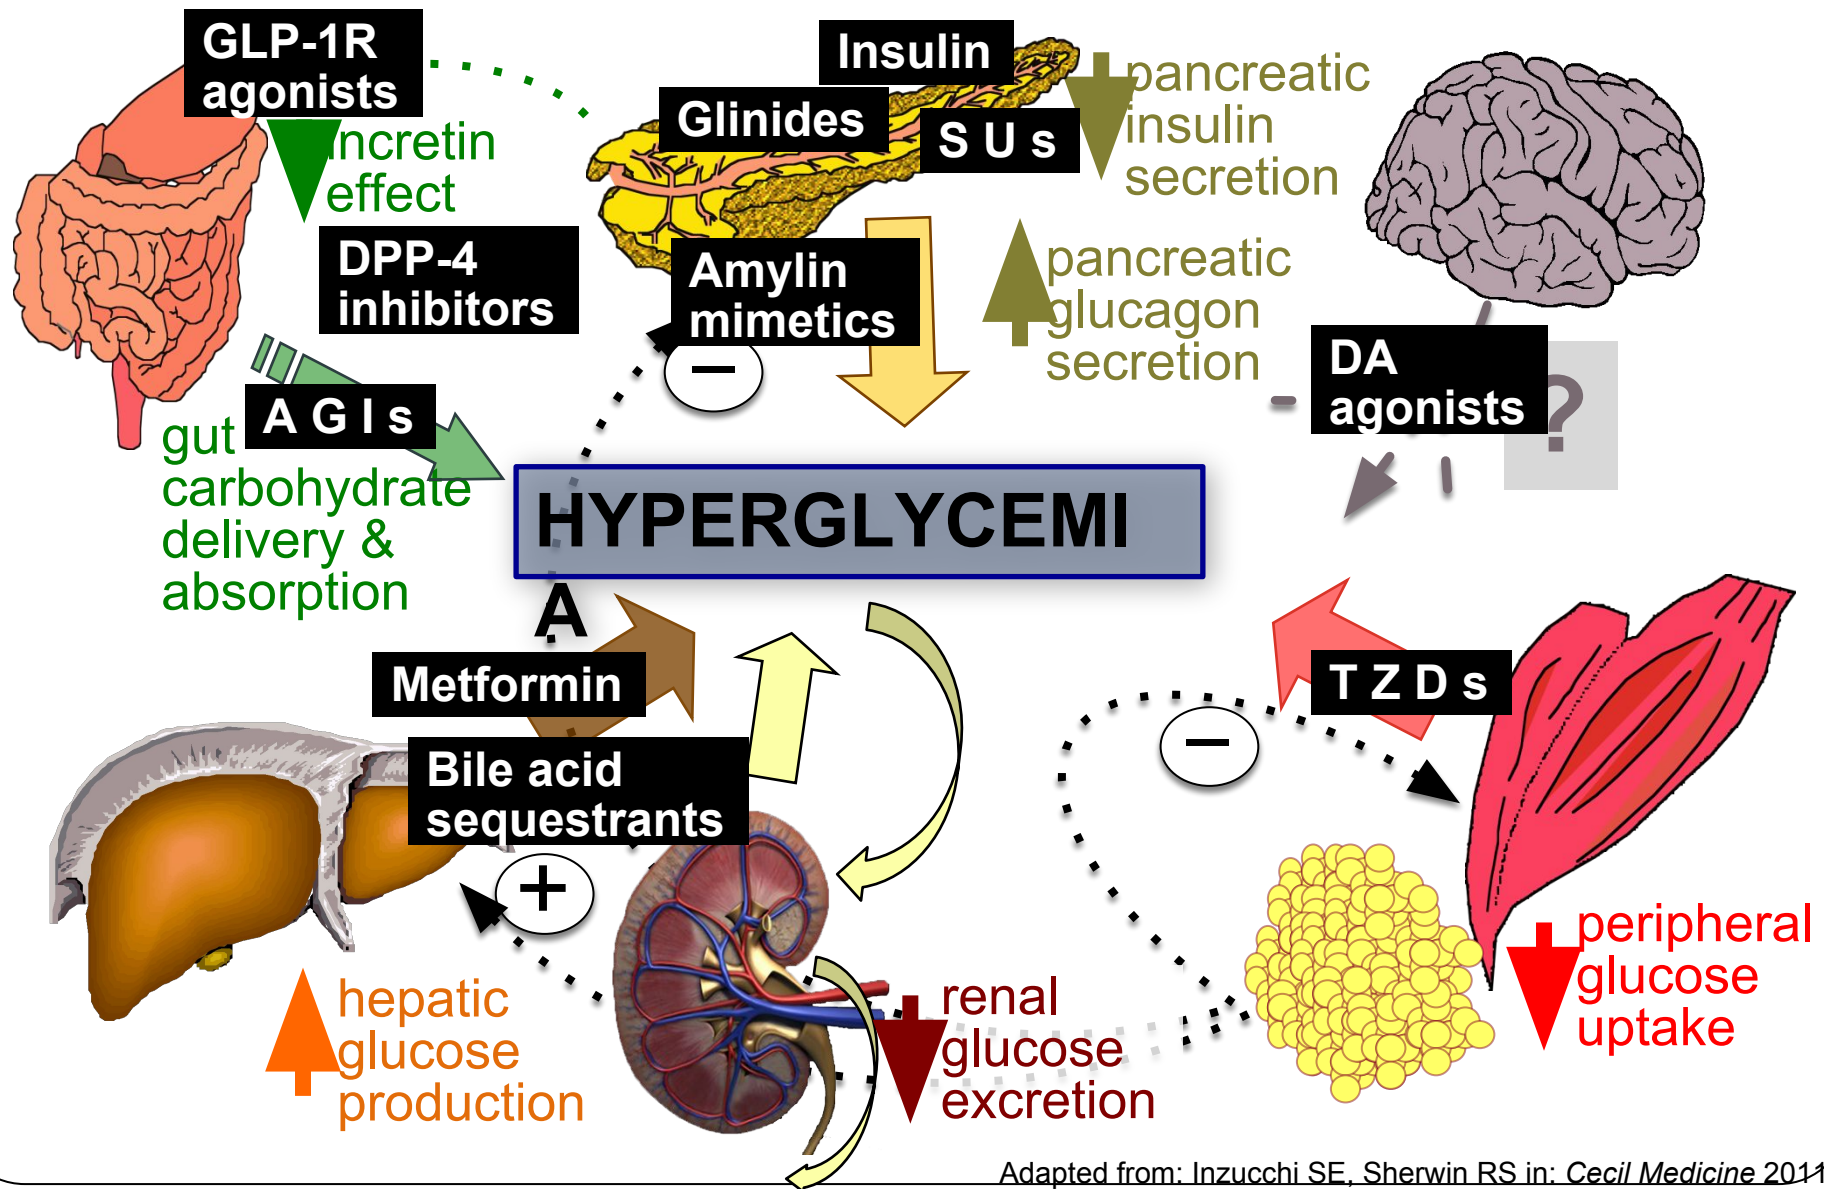

**Table 9.2—Drug-specific and patient factors to consider when selecting antihyperglycemic treatment in adults with type 2 diabetes**

		Efficacy (60)	Hypoglycemia	Weight change (109)	CV effects		Cost	Oral/SQ	Renal effects		Additional considerations
					ASCVD	HF			Progression of DKD	Dosing/use considerations*	
Metformin		High	No	Neutral (potential for modest loss)	Potential benefit	Neutral	Low	Oral	Neutral	<ul style="list-style-type: none"> <li>Contraindicated with eGFR &lt;30 mL/min/1.73 m<sup>2</sup></li> </ul>	<ul style="list-style-type: none"> <li>Gastrointestinal side effects common (diarrhea, nausea)</li> <li>Potential for B12 deficiency</li> </ul>
SGLT2 inhibitors		Intermediate	No	Loss	Benefit: empagliflozin <sup>†</sup> , canagliflozin <sup>†</sup>	Benefit: empagliflozin <sup>‡</sup> , canagliflozin, dapagliflozin <sup>‡</sup> , ertugliflozin	High	Oral	Benefit: canagliflozin <sup>§</sup> , empagliflozin, dapagliflozin <sup>§</sup>	<ul style="list-style-type: none"> <li>See labels for renal dose considerations of individual agents</li> <li>Glucose-lowering effect is lower for SGLT2 inhibitors at lower eGFR</li> </ul>	<ul style="list-style-type: none"> <li>Should be discontinued before scheduled surgery to avoid risk for DKA</li> <li>DKA risk (all agents, rare in T2)</li> <li>Risk of bone fractures (canagliflozin)</li> <li>Genitourinary infections</li> <li>Risk of volume depletion, hypotension</li> <li>↓ LDL cholesterol</li> <li>Risk of Fournier's gangrene</li> </ul>
GLP-1 RAs		High	No	Loss	Benefit: dulaglutide <sup>†</sup> , liraglutide <sup>†</sup> , semaglutide (SQ) <sup>†</sup>	Neutral	High	SQ; oral (semaglutide)	Benefit on renal end points in CVOTs, driven by albuminuria outcomes: liraglutide, semaglutide (SQ), dulaglutide	<ul style="list-style-type: none"> <li>See labels for renal dose considerations of individual agents</li> <li>No dose adjustment for dulaglutide, liraglutide, semaglutide</li> <li>Caution when initiating or increasing dose due to potential risk of nausea, vomiting, diarrhea, or dehydration. Monitor renal function in patients reporting severe adverse GI reactions when initiating or increasing dose of therapy.</li> </ul>	<ul style="list-style-type: none"> <li><b>FDA Black Box:</b> Risk of thyroid tumors in rodents; human relevance not determined (<b>liraglutide, dulaglutide, exenatide extended release, semaglutide</b>)</li> <li>GI side effects common (nausea, vomiting, diarrhea)</li> <li>Injection site reactions</li> <li>Pancreatitis has been reported in trials but causality has not been established. Discontinue if pancreatitis is suspected.</li> </ul>
DPP-4 inhibitors		Intermediate	No	Neutral	Neutral	Potential risk: saxagliptin	High	Oral	Neutral	<ul style="list-style-type: none"> <li>Renal dose adjustment required (sitagliptin, saxagliptin, alogliptin); can be used in renal impairment</li> <li>No dose adjustment required for linagliptin</li> </ul>	<ul style="list-style-type: none"> <li>Pancreatitis has been reported in trials but causality has not been established. Discontinue if pancreatitis is suspected.</li> <li>Joint pain</li> </ul>
Thiazolidinediones		High	No	Gain	Potential benefit: pioglitazone	Increased risk	Low	Oral	Neutral	<ul style="list-style-type: none"> <li>No dose adjustment required</li> <li>Generally not recommended in renal impairment due to potential for fluid retention</li> </ul>	<ul style="list-style-type: none"> <li><b>FDA Black Box:</b> Congestive heart failure (<b>pioglitazone, rosiglitazone</b>)</li> <li>Fluid retention (edema; heart failure)</li> <li>Benefit in NASH</li> <li>Risk of bone fractures</li> <li>Bladder cancer (pioglitazone)</li> <li>↓ LDL cholesterol (rosiglitazone)</li> </ul>
Sulfonylureas (2nd generation)		High	Yes	Gain	Neutral	Neutral	Low	Oral	Neutral	<ul style="list-style-type: none"> <li>Glyburide: generally not recommended in chronic kidney disease</li> <li>Glipizide and glimepiride: initiate conservatively to avoid hypoglycemia</li> </ul>	<ul style="list-style-type: none"> <li>FDA Special Warning on increased risk of cardiovascular mortality based on studies of an older sulfonylurea (tolbutamide)</li> </ul>
Insulin	Human insulin	High	Yes	Gain	Neutral	Neutral	Low (SQ)	SQ; inhaled	Neutral	<ul style="list-style-type: none"> <li>Lower insulin doses required with a decrease in eGFR; titrate per clinical response</li> </ul>	<ul style="list-style-type: none"> <li>Injection site reactions</li> <li>Higher risk of hypoglycemia with human insulin (NPH or premix formulations) vs. analogs</li> </ul>
	Analog						High	SQ			

ASCVD, atherosclerotic cardiovascular disease; CV, cardiovascular; CVOT, cardiovascular outcomes trial; DPP-4, dipeptidyl peptidase 4; DKA, diabetic ketoacidosis; DKD, diabetic kidney disease; eGFR, estimated glomerular filtration rate; GI, gastrointestinal; GLP-1 RAs, glucagon-like peptide 1 receptor agonists; HF, heart failure; NASH, nonalcoholic steatohepatitis; SGLT2, sodium-glucose cotransporter 2; SQ, subcutaneous; T2D, type 2 diabetes. \*For agent-specific dosing recommendations, please refer to the manufacturers' prescribing information. †FDA-approved for cardiovascular disease benefit. ‡FDA-approved for heart failure indication. §FDA-approved for chronic kidney disease indication.

**Table 1. Properties of anti-hyperglycemic agents**

# **SGLT2 Inhibitors**

- Endocrine Rev. 32, 515–531 (2011); permission conveyed through Copyright Clearance Center, Inc.

### Mechanism of action of SGLT2is

- Decrease intraglomerular pressure
- Decrease arterial stiffness
- Decrease vascular resistance
- Lower rate of hyperglycemia
- Decreased body weight
- Decrease in SBP and DBP

# Side effects

1. FDA black list risk of amputation (canagliflozin)
2. Risk of bone fracture (canagliflozin)
3. Risk of DKA
4. Genitourinary infection
5. Volume depletion & hypotension
6. Increase LDL cholesterol

**Table 1.** Kidney Outcomes in Clinical Trials of SGLT2 Inhibitors

Study	Intervention	Study Population	Outcomes
EMPA-REG OUTCOME (NCT01131676) <sup>56,84</sup>	Empagliflozin	T2DM, eGFR $\geq 30$ ; high CV risk	<ul style="list-style-type: none"> <li>• 44% RR reduction of Scr doubling (1.5% vs 2.6%)</li> <li>• 38% RR of progression to UACR <math>&gt; 300</math> (11.2% vs 16.2%)</li> <li>• 55% RR reduction of initiation of KRT (0.3% vs 0.6%)</li> <li>• Slowing of decline in GFR (annual decrease of <math>0.19 \pm 0.11</math> vs <math>1.67 \pm 0.13</math>; <math>P &lt; 0.001</math>)</li> </ul>
CREDENCE (NCT02065791) <sup>86</sup>	Canagliflozin	T2DM; HbA <sub>1c</sub> [6.5%, 12%]; high CV risk; UACR [300, 5,000]; eGFR [30, 90]	<ul style="list-style-type: none"> <li>• Trial in progress; estimated completion in June 2019</li> <li>• Primary outcome: time to the 1st occurrence of an event in the primary composite end point (ESRD, Scr doubling, kidney or CV death)</li> </ul>
CANVAS, CANVAS R (NCT01032629, NCT01989754) <sup>85</sup>	Canagliflozin	T2DM; HbA <sub>1c</sub> [7%, 10.5%], high CV risk; median UACR 12.3; mean eGFR 76.5	<ul style="list-style-type: none"> <li>• <math>\downarrow</math> progression of albuminuria (HR, 0.73; 95% CI, 0.67-0.79)</li> <li>• <math>\downarrow</math> composite outcome of 40% reduction in eGFR, KRT, or kidney death (HR, 0.60; 95% CI, 0.47-0.77)</li> </ul>
Dapa-CKD (NCT03036150) <sup>87</sup>	Dapagliflozin	T2DM; eGFR [25, 75]; UACR [200, 5,000]	<ul style="list-style-type: none"> <li>• Trial in progress; estimated completion in November 2020</li> <li>• Primary outcome: time to 1st occurrence of any of the components of the primary composite end point (ESRD, <math>\geq 50\%</math> sustained decline in eGFR, kidney or CV death)</li> </ul>
DECLARE-TIMI-58 (NCT01730534) <sup>93</sup>	Dapagliflozin	T2DM; high CV risk	<ul style="list-style-type: none"> <li>• Trial in progress; estimated completion in April 2019</li> <li>• Secondary outcome measures: time to 1st event of kidney composite end point (confirmed sustained <math>\geq 40\%</math> decrease in eGFR to eGFR <math>&lt; 60</math> and/or ESRD and/or kidney or CV death [time frame: up to 6 y])</li> </ul>

- CANVAS R: The **primary** end point was
- Development of microalbuminuria or macroalbuminuria in participants with baseline normoalbuminuria
- Development of macroalbuminuria in participants with baseline microalbuminuria, accompanied by an increase in the urinary Alb /Cr ratio of  $\geq 30\%$  from baseline

## Renal outcome of nephropathy of Empagliflozin

**A Incident or Worsening Nephropathy**

**No. at Risk**

N Engl J Med. 2017 Aug 17;377(7):644-657

## Kidney Function Dose Adjustments for Approved SGLT2 Inhibitors

SGLT2 Inhibitor	Dose	Kidney Dose Adjustment
Dapagliflozin	5-10 mg	Avoid initiating if eGFR < 60 Not recommended with eGFR 30-60 Contraindicated with eGFR < 30
Empagliflozin	10-25 mg	No dose adjustment if eGFR ≥ 45 Avoid use, discontinue with eGFR persistently <45
Canagliflozin	100-300 mg	No dose adjustment if eGFR > 60 100 mg daily if eGFR 45-59 Avoid use, discontinue with eGFR persistently <45
Ertugliflozin	5-15 mg	Avoid initiating if eGFR 30-60 Continued use is not recommended with persistent eGFR 30-60 Contraindicated with eGFR < 30

# The Incretin Effect

Oral glucose load      Intravenous

min=minute; nmol=nano mole; L=liter; IR-insulin=insulin immunoreactivity.

1. Nauck M et al. *Diabetologia*. 1986;29:46–52. Copyright © 1986 Springer-Verlag

It's been calculated that up to **70%** of postglucose insulin secretion is due to the effects of these incretin hormones

# ROLE OF INCRETIN IN GLUCOSE HOMEOSTASIS

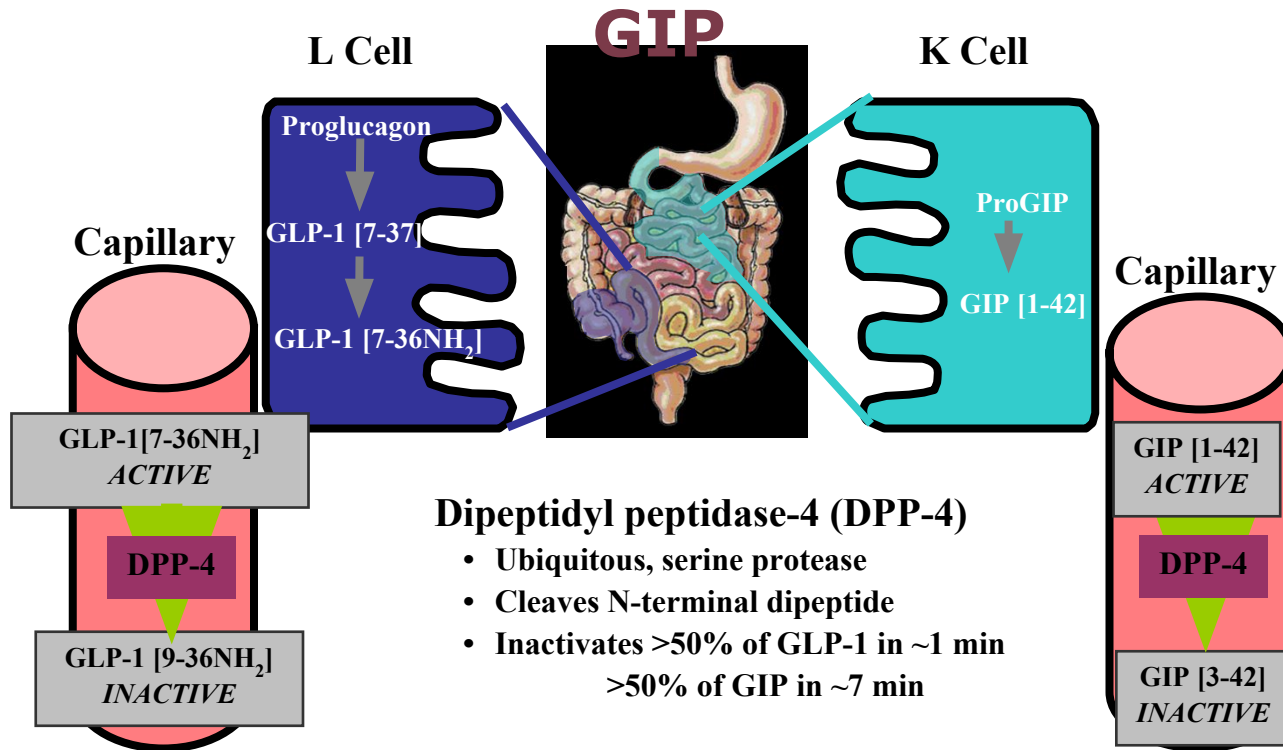

## IN-CRET-IN

INtestine seCRETion INsulin

Definition: Hormones produced by the gastrointestinal tract in response to incoming nutrients, and increase glucose stimulated insulin secretion

Two hormones: (1) glucagon-like peptide-1 (GLP-1)  
(2) glucose-dependent insulinitropic polypeptide (GIP)

# Synthesis, Secretion, and Metabolism of the Incretin Hormones GLP-1 and GIP

**Figure 1**

# Antihyperglycemic Therapy in Adults with Type 2 Diabetes

At diagnosis, initiate lifestyle management, set A1C target, and initiate pharmacologic therapy based on A1C:

A1C is less than 9%, **consider Monotherapy.**

A1C is greater than or equal to 9%, **consider Dual Therapy.**

A1C is greater than or equal to 10%, blood glucose is greater than or equal to 300 mg/dL, or patient is markedly symptomatic, **consider Combination Injectable Therapy** (See Figure 8.2).

## Monotherapy

Lifestyle Management + Metformin

Initiate metformin therapy if no contraindications\* (See Table 8.1)

A1C at target  
after 3 months  
of monotherapy?

- Yes:** - Monitor A1C every 3–6 months
- No:** - Assess medication-taking behavior  
- Consider Dual Therapy

## Dual Therapy

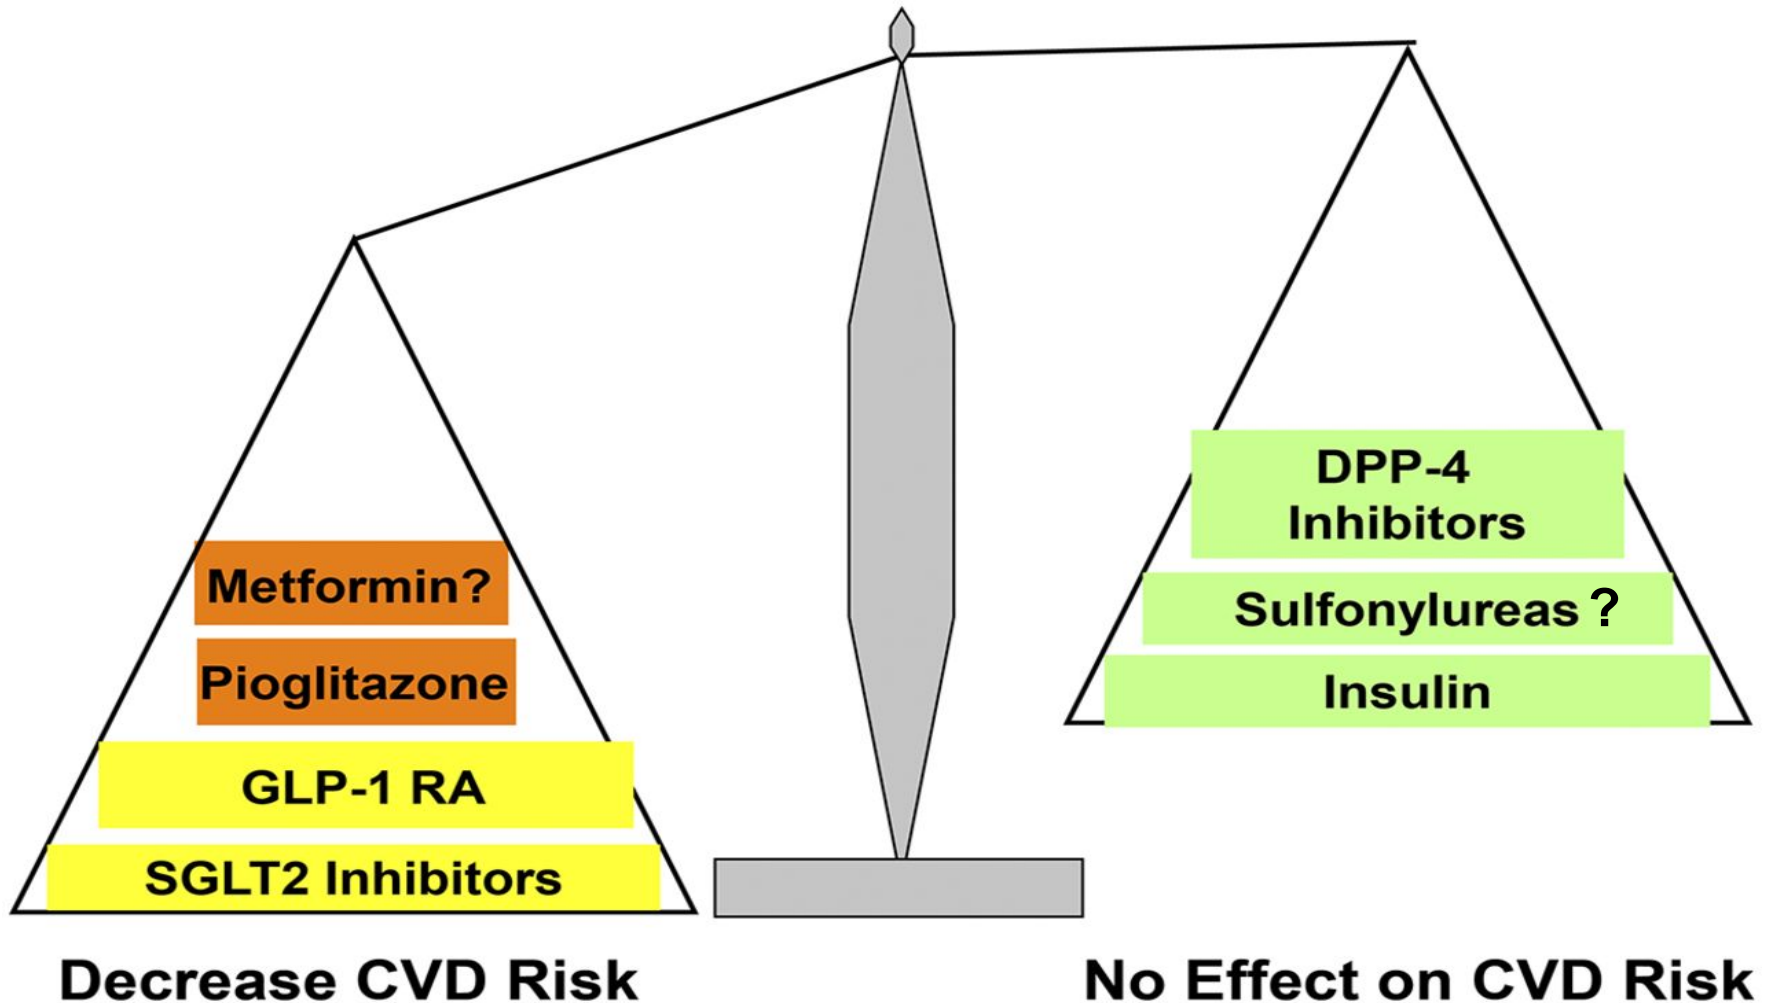

Lifestyle Management + Metformin + Additional Agent

**Yes:** Add agent proven to reduce major adverse

## American Diabetes Association recommendation-2022

- In patients with type 2 diabetes and established atherosclerotic cardiovascular disease, antihyperglycemic therapy should begin with lifestyle management and metformin and **subsequently incorporate an agent proven to reduce major adverse cardiovascular events and cardiovascular mortality** (currently empagliflozin and liraglutide), after considering drug-specific and patient factors. (A)

# Cardiovascular risk profile of antidiabetes medications

**Dual Therapy**

**Lifestyle Management + Metformin + Additional Agent**

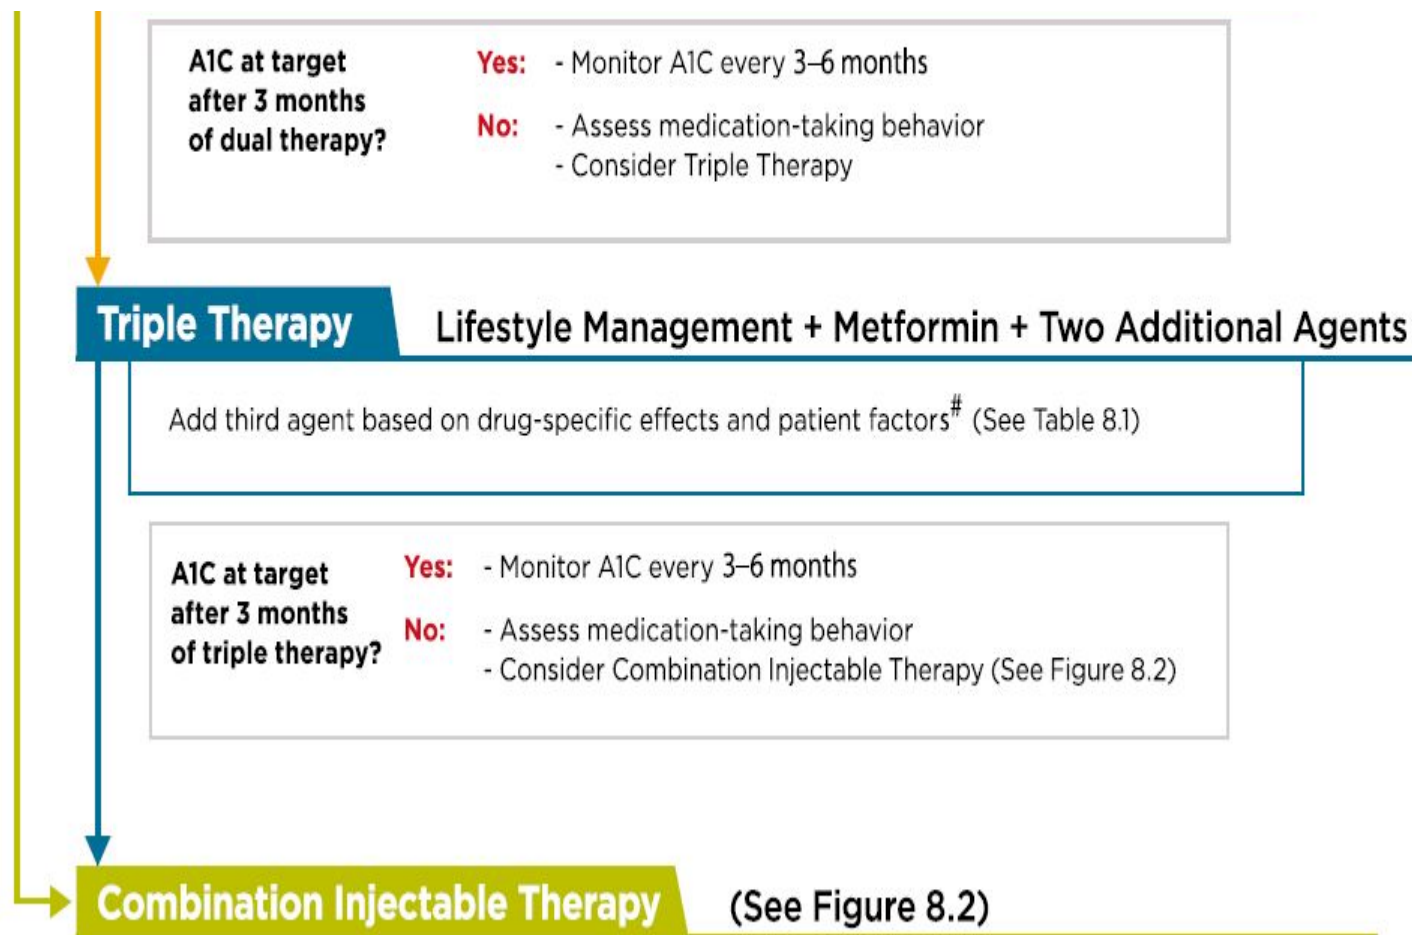

- ASCVD?**
- Yes:** - Add agent proven to reduce major adverse cardiovascular events and/or cardiovascular mortality (see recommendations with \* on p. S75 and **Table 8.1**)
- No:** - Add second agent after consideration of drug-specific effects and patient factors (See Table 8.1)

**A1C at target  
after 3 months  
of dual therapy?**

- Yes:** - Monitor A1C every 3–6 months
- No:** - Assess medication-taking behavior  
- Consider Triple Therapy

**Triple Therapy**

**Lifestyle Management + Metformin + Two Additional Agents**

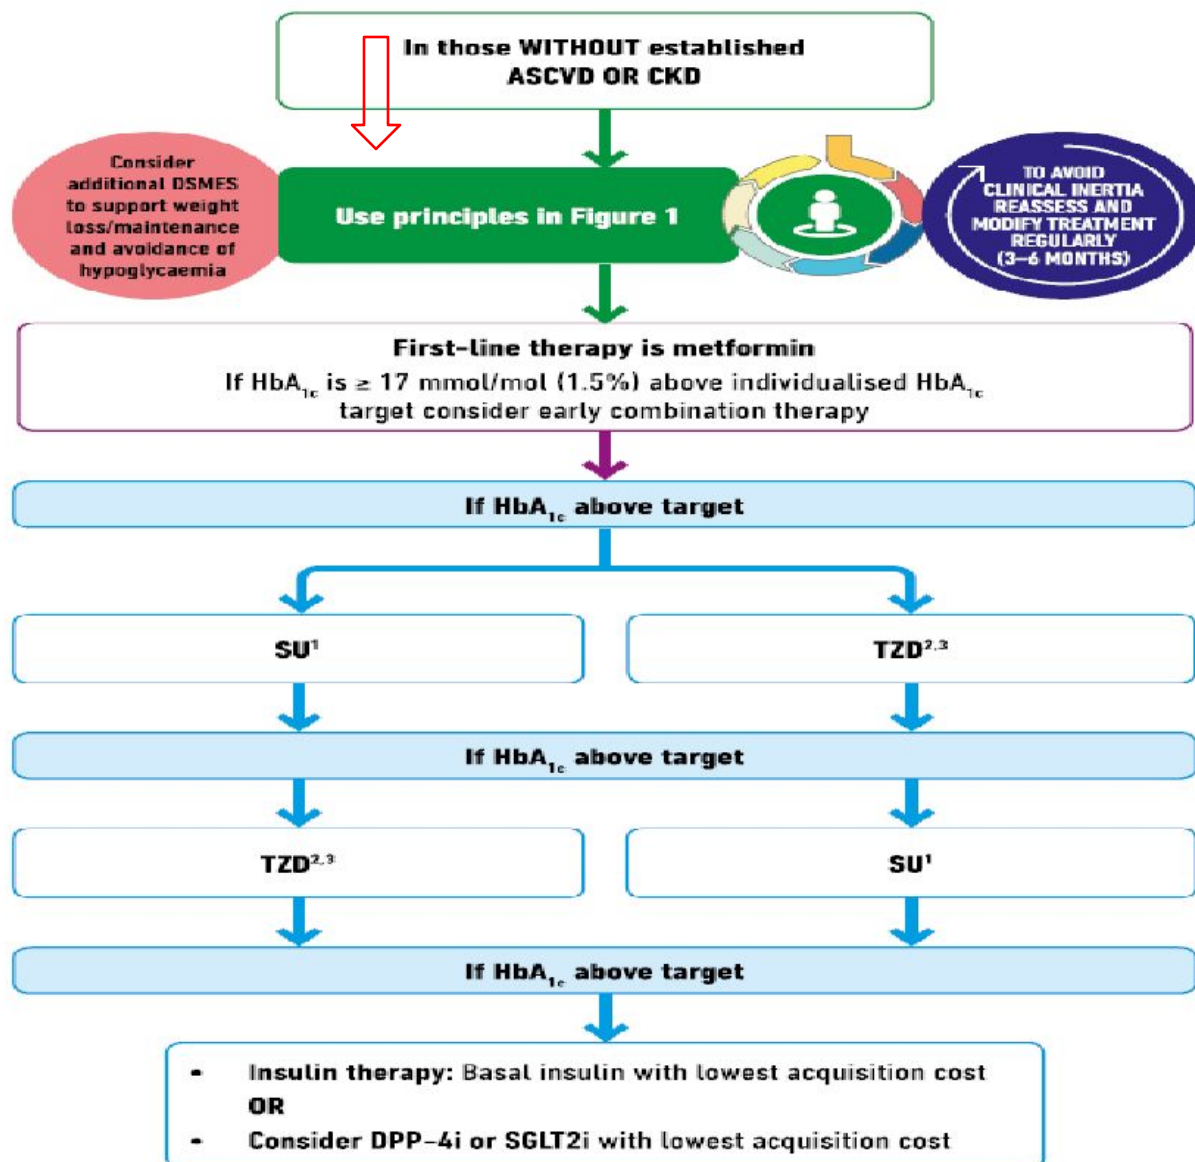

**Figure 8.1—Antihyperglycemic therapy in type 2 diabetes: general recommendations.** \*If patient does not tolerate or has contraindications to metformin, consider agents from another class in Table 8.1. **GLP-1 receptor agonists and DPP-4 inhibitors should not be prescribed in combination** If a patient with ASCVD is not yet on an agent with evidence of cardiovascular risk reduction, consider adding.

# Expected HbA<sub>1c</sub> reduction according to intervention

Intervention	Expected ↓ in HbA <sub>1c</sub> (%)
Lifestyle interventions	1 to 2%
Metformin	1 to 2%
Sulfonylureas	1 to 2%
Insulin	1.5 to 3.5%
Glinides	1 to 1.5% <sup>1</sup>
Thiazolidinediones	0.5 to 1.4%
α-Glucosidase inhibitors	0.5 to 0.8%
GLP-1 agonist	0.5 to 1.0%
Pramlintide	0.5 to 1.0%
DPP-IV inhibitors	0.5 to 0.8%

# CHOOSING GLUCOSE-LOWERING MEDICATION IF COST IS A MAJOR ISSUE

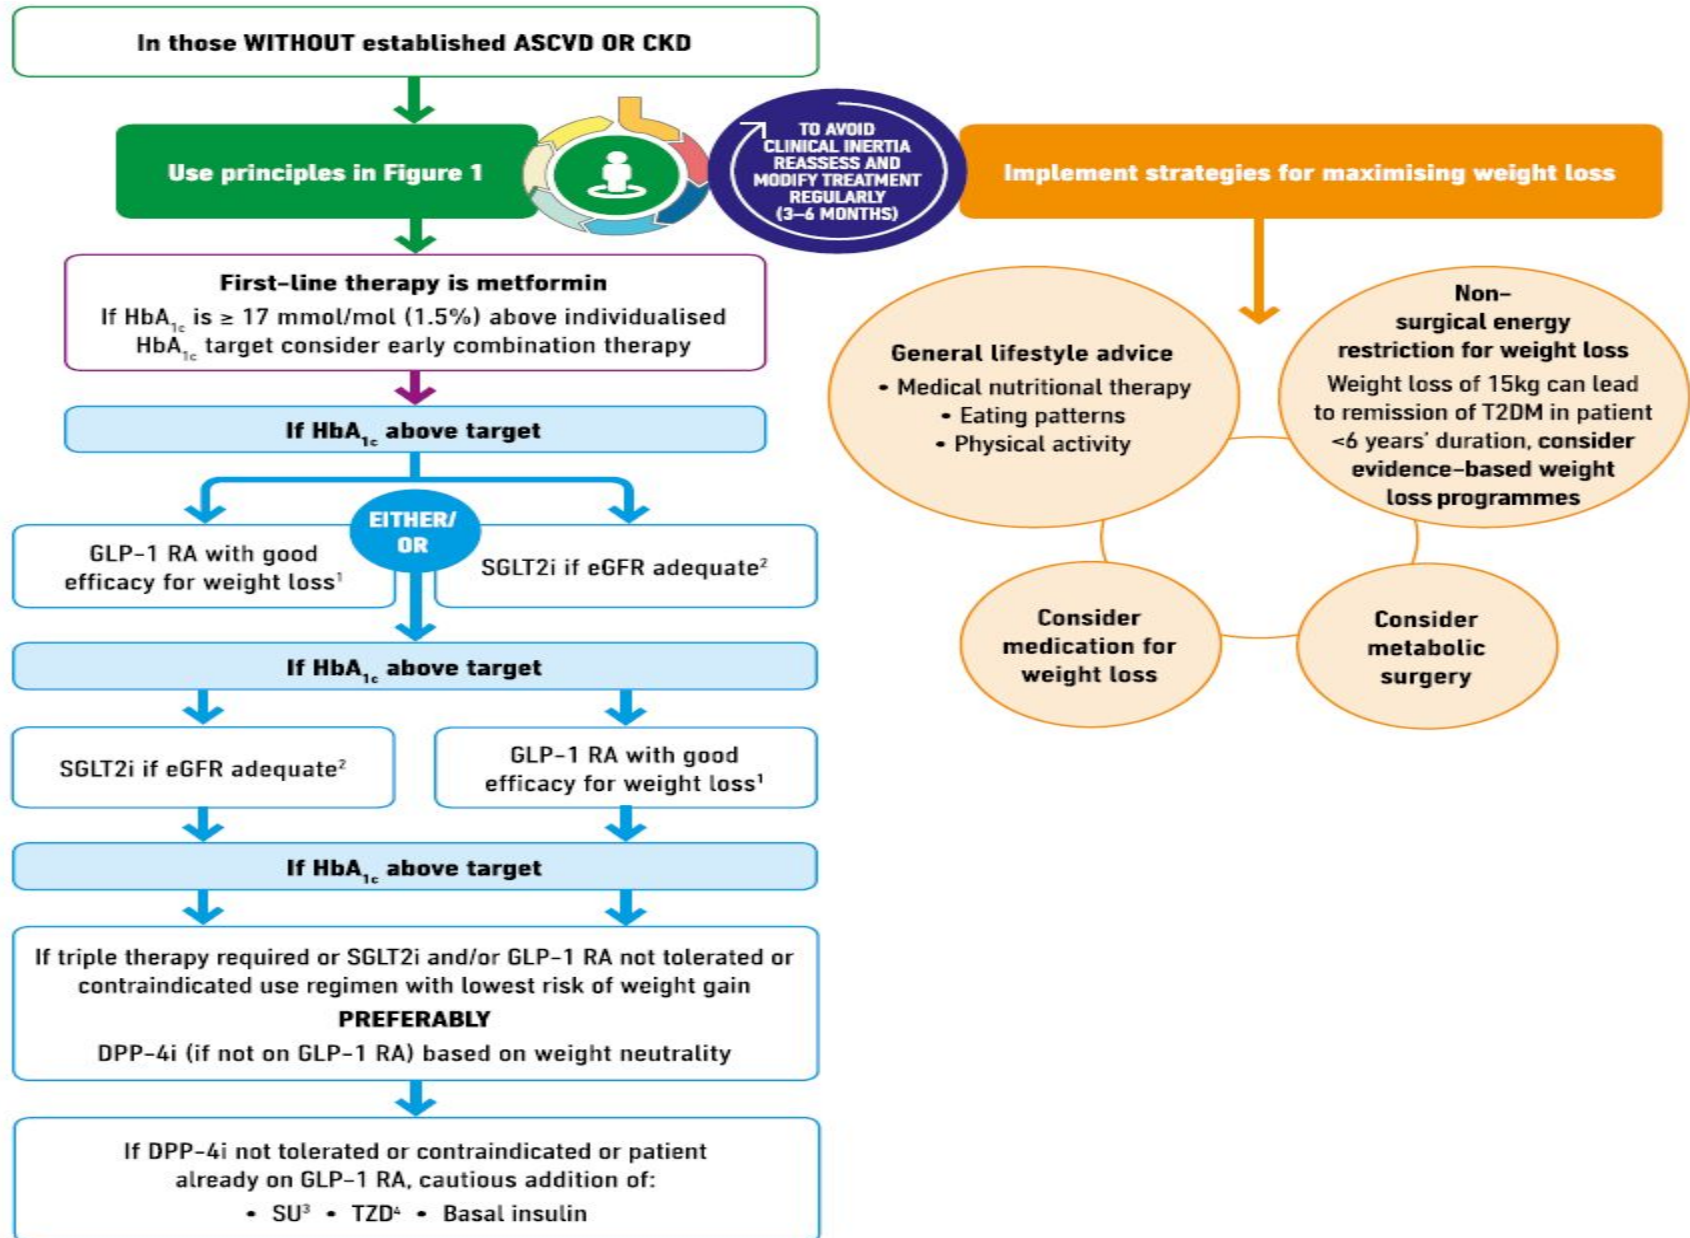

نام دارو	تعداد	قیمت (تومان)	پوشش بیمه
متفورمین	100	11000 (25150)	√
Gly-Once 500-750	100	24.000-30.000	●
گلی بن کلامید	100	5200	√
گلی کلایزید 80	100	13000 (19000)	√
Empagliflozin 10	30	82.500	●
ریپگلیناید (2-1-05)	100	8500-14.400-20.000	√
گلو تازون (45-30-15)	100	35-42-50000	●
آکاربوز (100-50)	100	27.000-50.000	●
سیتاگلیپتین 100-50	30	39.750-79500	●
NPH	1 ویال	18.840	√
Regular	1 ویال	18.840	√
سرنگ	100 عدد	20000	●

# CHOOSING GLUCOSE-LOWERING MEDICATION IF COMPELLING NEED TO MINIMISE WEIGHT GAIN OR PROMOTE WEIGHT LOSS

# CHOOSING GLUCOSE-LOWERING MEDICATION IF COMPELLING NEED TO MINIMISE HYPOGLYCAEMIA

In those **WITHOUT** established  
ASCVD OR CKD

Use principles in Figure 1

TO AVOID  
CLINICAL INERTIA  
REASSESS AND  
MODIFY TREATMENT  
REGULARLY  
(3-6 MONTHS)

Identify patient groups at highest risk of hypoglycaemia and set and/or adjust HbA<sub>1c</sub> target to minimise risk of hypoglycaemia

**First-line therapy is metformin**  
If HbA<sub>1c</sub> is  $\geq 17$  mmol/mol (1.5%) above individualised  
HbA<sub>1c</sub> target consider early combination therapy

If HbA<sub>1c</sub> above target

DPP-4i

GLP-1 RA

SGLT2i<sup>1</sup>  
if eGFR adequate

TZD<sup>2</sup>

If HbA<sub>1c</sub> above target

If HbA<sub>1c</sub> above target

If HbA<sub>1c</sub> above target

If HbA<sub>1c</sub> above target

SGLT2i<sup>1</sup> or TZD<sup>2</sup>

SGLT2i<sup>1</sup> or TZD<sup>2</sup>

GLP-1 RA or  
DPP-4i or  
TZD<sup>2</sup>

SGLT2i<sup>1</sup> or  
DPP-4i or  
GLP-1 RA

If HbA<sub>1c</sub> above target

Continue with addition of other agents as outlined above

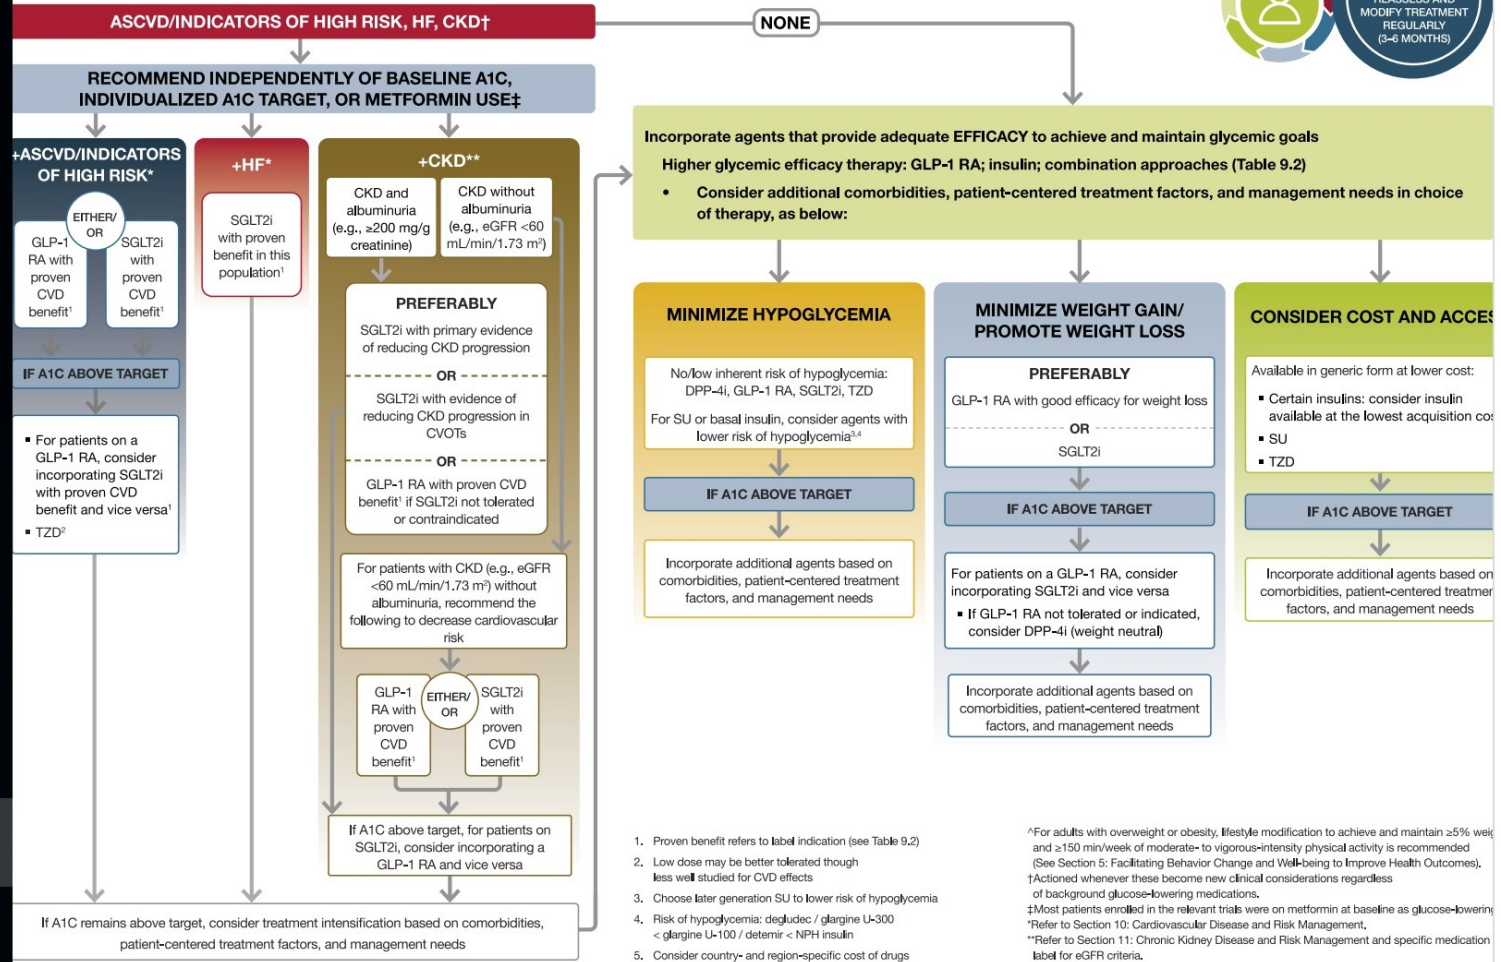

If HbA<sub>1c</sub> above target

Consider the addition of sulfonylurea **OR** basal insulin:

- Choose later generation SU with lower risk of hypoglycaemia
- Consider basal insulin with lower risk of hypoglycaemia<sup>3</sup>

## PHARMACOLOGIC TREATMENT OF HYPERGLYCEMIA IN ADULTS WITH TYPE 2 DIABETES

**FIRST-LINE THERAPY** depends on comorbidities, patient-centered treatment factors, including cost and access considerations, and management needs and generally includes metformin and comprehensive lifestyle modification<sup>4</sup>

**Figure 9.3—Pharmacologic treatment of hyperglycemia in adults with type 2 diabetes.** 2022 ADA Professional Practice Committee (PPC) adaptation of Davies et al. (43) and Buse et al. (44). For appropriate context, see Fig. 4.1. The 2022 ADA PPC adaptation emphasizes incorporation of therapy rather than sequential add-on, which may require adjustment of current therapies. Therapeutic approach should be tailored to comorbidities, patient-centered treatment factors, and management needs. ASCVD, atherosclerotic cardiovascular disease; CKD, chronic kidney disease; CVD, cardiovascular disease; CVOTs, cardiovascular outcomes trials; DPP-4i, dipeptidyl peptidase 4 inhibitor; eGFR, estimated glomerular filtration rate; GLP-1 RA, glucagon-like peptide 1 receptor agonist; HF, heart failure; SGLT2i, sodium-glucose cotransporter 2 inhibitor; SU, sulfonylurea; TZD, type 2 diabetes; TZD, thiazolidinedione.
